

Lead Quality Analysis & Optimization Strategy

By: Ishaan Rakhecha
ishaanrworks@gmail.com

Role: Data Analyst Case Study

Objective:

Analyze lead quality trends, identify key drivers of lead quality, and recommend strategies to improve lead quality by 20%

Tools Used:

- Python
- Google Colab
- Power BI

Dataset:

~3,000 leads containing lead outcomes, campaign information, traffic sources, widgets, debt levels, and verification scores.

Business Problem

The advertiser purchases leads generated through various advertising campaigns and traffic sources.

The primary objective is to understand:

1. Whether lead quality is improving or declining over time.
2. Which factors influence lead quality.
3. Whether lead quality can be improved by 20%, allowing the advertiser to increase CPL from \$30 to \$33.

Lead quality was defined using lead outcomes:

Good Leads:

- Closed
- EP Sent
- EP Received
- EP Confirmed

Bad Leads:

- Unable to Contact
- Invalid Profile
- Doesn't Qualify

Unknown: • All remaining lead outcomes.

Key Findings

- Total Leads Analyzed: 3,021
- Good Leads: 393
- Overall Lead Quality: 13.01%
- Closed Rate: 8.11%
- Lead quality fluctuated over time, ranging between approximately 9% and 17%.
- September recorded the highest lead quality during the analysis period.
- The trend suggests recovery and improvement after a quality decline in July.

Lead Quality Drivers

Widget Performance

- Best-performing widget achieved 24.49% lead quality.
- Worst-performing widget achieved 6.67% lead quality.

Partner Performance

- Advertise.com generated the highest quality leads (33.33%).
- Google generated the lowest quality leads (11.12%).

Publisher Campaign Performance

- Call Center leads outperformed online form submissions.

PhoneScore Impact

- PhoneScore 5 leads achieved the highest quality rates.
- Strong phone verification correlates with better lead outcomes.

Debt Level Impact

- Certain debt ranges significantly outperformed others, indicating opportunities for better targeting.

Advertiser Campaign Impact

- Branded and generic campaigns produced nearly identical lead quality, suggesting branding had minimal impact on lead quality.

Optimization Strategy

Current Lead Quality: 13.01%

Target Lead Quality: 15.60%

Required Improvement: 2.59 percentage points

Recommended Actions:

- 1. Increase traffic allocation to the highest-performing widgets.
- 2. Shift budget toward top-performing partners, particularly Advertise.com and AdKnowledge.
- 3. Expand Call Center lead acquisition efforts.
- 4. Prioritize leads with high PhoneScore values.
- 5. Reduce investment in consistently low-performing traffic sources.

Expected Result:

Based on observed segment performance, the 20% lead quality improvement target appears achievable through traffic reallocation and optimization of high-performing channels.

Conclusion

The analysis identified several significant drivers of lead quality, including widget design, traffic source, phone verification quality, and acquisition channel.

Lead quality improved toward the end of the analysis period and multiple high-performing segments substantially exceeded the target quality rate of 15.6%.

By reallocating spend toward high-performing widgets, partners, and acquisition channels, the advertiser can reasonably improve lead quality while supporting the proposed increase in CPL from \$30 to \$33.

This recommendation is supported by both trend analysis and segment-level performance analysis conducted on approximately 3,000 leads.
